TITLE: On some elementary models of a calculating medium

SOURCE: Ref. zh. Kibernetika, Abs. 11G31

REF SOURCE: Sb. Vychisl. sistemy, Vyp. 16. Novosibirsk, 1965, 73-86

TOPIC TAGS: mathematic model, electric relay, automatic machine, teaching machine, algebra, logic design

ABSTRACT: Some results obtained in examining the possibility and advisability of modeling a calculating medium with ordinary elements are described. Models of a calculating medium of ordinary relays, which are of independent practical interest as a general-purpose device for tuning in the realization of the circuit of any elementary automatic device, are presented. The models can also be used as elementary teaching machines of the examiner and repeater type. In addition, they can serve as a "logical designer" for performing the functions of the algebra of logic, terminal automatic machines, graphs, etc. Two types of general-purpose logical designers, which were built by the experimental workshops of the Institute of Mathematics, Siberian Division, AN SSSR, are described. Examples of solution of some elementary problems by means of logical designers are given. 8 illustrations. Bibliography of 4 citations. V. M. [Translation of abstract]

TITLE: matrix p -language for the description of parallel algorithms

SOURCE: Ref. zh. Matematika, Abs. 3V373

TOPIC TAGS: computer language, algorithm

TRANSLATION: A matrix language is introduced for describing systems of parallel algorithms. Simple and generalized operators are used as elements of the language. The generalized operators are sequences of several simple operators if 1) one and only one of the simples in it has an outside input, 2) only one operator is executed at each moment of time, 3) all simple operators will be executed in a finite number of steps after the operators having an outside input are executed. Established designations are used for some of the more frequently encountered operators. Several standard p -operators are considered. A logical circuit is defined for a p -algorithm as a matrix of the elements of the j th column of which are simple or general operators, or else "jump if not" operators, and the elements of the i th row are operators forming a trail corresponding to the i th branch of the computations. Possible forms for the notation of the circuits of a p -algorithm in terms of a matrix language are described. It is observed

UDC: 681.142.001:51

Card 1/2

L 05670-67

ACC NR: AR6023254

that logical circuits for p -algorithms can be recorded in the form of graphs in order to clarify the structure of the connections between branches of computations. The problem of multiplying two quadratic matrices is studied as an example of the recording of a p -algorithm in a p -language. Yu. U.

TITLE: The solution of problems on universal digital computer systems

SOURCE: Ref. zh. Matematika, Abs. 6V330

REF SOURCE: Sb. Vychisl. sistemy. Vyp. 17. Novosibirsk, 1965, 106-164

TOPIC TAGS: algorithm, machine language, computer application, digital computer numerica solution

ABSTRACT: The feasibility of the efficient solution of problems on universal computer systems with a large number of machines has been investigated. For that purpose the paper presents 16 types of problems covering the basic fields of mathematics: 1. The solution of a system of linear equations by means of successive approximations. 2. The inversion of matrices by the method of approximations. 3. The evaluation of eigenvalues of matrices using the Danilevskiy method. 4. The solution of the general problem of linear programming by the modified simplex method. 5. The solution of the general transport problem. 6. The problem of numerical differentiation. 7. The problem of numerical integration. 8. The solution of the Cauchy problem for the system of differential equations by the Runge-Kutta method. 9. The solution of the boundary problem for a system of linear differential equations by the method of

Card 1/2

UDC: 518.5:681.142

L 08589-67

ACC NR: AR6029276

conjugate equations. 10. The boundary problem for nonlinear equations. 11. The solution of the Dirichlet problem for elliptical equations by the interaction method. 12. The boundary problem for parabolic equations. 13. The Cauchy problem for linear differential equations of the hyperbolic type. 14. The method of statistical solutions. 15. The problem of the theory of statistical solutions. 16. Information-logical problem. These problems were solved with the help of the best-known methods for their solution. The paper gives the estimate of the number of cycles needed for the solution of each of the particular problems and the necessary memory volume. For each type of problem, the logical scheme of the algorithm is also found, described by means of the P-language. Simultaneously, for each of the problems one searches for such a number $k > 1$ of machines entering into the universal computer system that the problem is solved on such a system k times faster than on a single machine. It is assumed that each machine entering into the universal computer system has a set of operations determined by the totality of problems which are being solved.

TITLE: A general purpose computer system with a partially variable structure ¹⁶⁶

SOURCE: Ref. zh. Avtomat telemekh i vychisl tekhn, Abs. 5B16

REF SOURCE: Sb. Vychisl. sistemy. Vyp. 17. Novosibirsk, 1965, 3-60

TOPIC TAGS: computer design, finite automation, computer system, general purpose computer

ABSTRACT: The general-purpose computer with a partially variable structure is defined as an s-terminal network with one elementary machine (EM) at each of its nodes. The input and output terminals of each EM are identified with the output and input terminals of adjacent elementary machines correspondingly. In addition, a certain subset of the input and output terminals is set aside for the whole general-purpose computer system. The EM consists of a finite automaton K with inputs x_{1l} and outputs z_{1l} , $l = 0, 1, \dots, n$, $l = 1, 2, 3$ and a general purpose V. M. Glushkov programming automaton capable of realizing the operations such as transmission and reception of information, generalized conditional transfer, and adjustment. It is proved that any finite automaton may be realized with this general-purpose computer system which is universal in V. M. Glushkov's sense and capable of performing any parallel algorithm.

TITLE: Theoretical bases for universal computational environments

SOURCE: Ref. zh. Mat., Abs. 10V304

REF SOURCE: Sb. Vychisl. sistemy, Vyp. 16. Novosibirsk, 1965, 3-72

TOPIC TAGS: computer, computer theory, computer research, computer system

ABSTRACT: Properties of a computational environment with individual behavior of the elements, and features of its realization are investigated. The computational environment consists of identical universal elements; each realizes the full system of algebra logic functions, signal delay, and a full system of switching functions to other elements, and possesses the capability of tuning the elements for the completion of the indicated functions. Questions related to the tuning of the computational environment are considered. Methods of tuning are disclosed. Variants of physical realization of the elements are considered. It is noted that the element realizing the function $z = (x_1 \vee x_2) = x_1 \wedge x_2$ (arrow of Pierce) can be built on one transistor and resistors. Logical systems of computational environment elements are considered. Examples of registers, counters, decoders, adders and memory systems are presented. Producibility, flexibility and reliability of the computational environment are noted. [Translation of abstract].

TITLE: A matrix p language for describing parallel algorithms

SOURCE: Ref. zh. Avtomat ¹⁶telemekh i vychisl tekhn, Abs. 3B82

REF SOURCE: Sb. Vychisl. sistemy. Vyp. 17, Novosibirsk, 1965, 100-105

TOPIC TAGS: computer language, algorithmic language, computer programming

ABSTRACT: A matrix language is proposed for describing parallel algorithm flowcharts. Simple and generalized operators are used as language elements. The latter represent a sequence of several simple operators, if one and if only one of them has an external input: at any moment of time only one such operator is executed; after a finite number of steps, all other simple operators are executed. A p-algorithm flowchart is established. Several possible ways of writing p-algorithms in terms of the matrix language are discussed. It is indicated that to ascertain the relationship between computation branches, a p-algorithm flowchart can be produced in the form of graphs. As an example, the multiplication of two matrices is considered. [Translation of abstract]. Bibliography of 9 titles. Yu. U.

TOPIC TAGS: computer calculation, computer research, computer program, algorithm

ABSTRACT: Some of the most widely used methods for solving several types of problems encountered in all the basic branches of computer mathematics are considered. Algorithms are proposed for solving the problem of linear programming, the general transport problem, and problems of mathematical analysis (integration and differentiation of functions). The realization of statistical test and solution methods is discussed, together with the solution of certain information and logical problems. It is noted that for all the problems considered it was possible to find such parallel algorithm schemes in which the total volume of stored information is evenly distributed between the elementary units of a computing complex. PERIODICAL: Tr. Leningr. in-ta inzh. vodn. transp. (Transactions of the
Leningrad Institute of Water Transportation), 1956, Nr 23, pp 10-20

ABSTRACT: Short flooded diverging channels are characterized (as compared to
prismatic channels) by a higher carrying capacity and a lower outflow velocity.
The increase in carrying capacity, accompanied by a decrease in outflow
velocity, produced by a funnel-shaped nozzle, is explained by the formation of
a vacuum in the nozzle. The effect of the shape of short head channels on the
rate and the nature of outflow should be considered in designing hydroengineer-
ing installations, particularly navigable sluices. The diverging shape of short
flooded channels permits cutting the time needed to fill the sluice chambers and
helps to meet a number of other conditions. The article presents a review of

TITLE: The Splitting of Pyrazoline Rings by the Acylation.
Rasskhocheniye pirazolinovogo kol'tsa pri atsilirovanii, Russian)
PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol 113, Nr 4, pp 813 - 816
(U.S.S.R.)
Received: 6 / 1957 Reviewed: 7 / 1957
ABSTRACT: The pyrazolines, which lack a substituent on the nitrogen atom
can, under the influence of the anhydrides of acids or of chlorine,
be transformed into corresponding N-acylpyrazoline. However, acylation
is sometimes anomalous. It was found to be possible to direct re-
action between benzoyl chloride and pyrazoline, according to their
conditions, either in the direction of a complete disruption of the
pyrazoline ring with formation of dibenzoyl hydrazine or in the
direction of a normal benzoylation. If pyrazoline is introduced
into the abundance of benzoyl chloride in the presence of water
alkali, dibenzoyl hydrazine alone is produced. In the case of an
inverse order of mixtures or of a complete lack of water, benzoyl-
pyrazoline alone is produced. In the case of acetone azine the
reaction is the same. By the splitting of acetone azine, acetone is
produced, which is identified as a semicarbazole whereas from pyra-
zoline mesitylene oxide was produced, which was also transformed
into semicarbazole. The ability of pyrazoline to disrupt the CN
binding corresponds to the analogous properties of its structural

Card 1/2

The Splitting of Pyrazoline Rings by Acylation.

PA - 2714

analogy: 8-aminoacetone. The formation of dibenzoylhydrazine was also observed on the occasion of the treatment of 4-ethyl 5-propylpyrazoline with benzoyl. This effect of chlorine benzoyl is not specific. Benzoyl pyrazoline resists the effect of chlorine benzoyl (at various conditions), but 1-benzoyl-3,5,5-trimethylpyrazoline splits easily and forms N,N'-dibenzoylhydrazine. The acid anhydrides acylate the pyrazolines without causing the ring open although it is known that the azines can be split by them. The aforementioned reactions are explained in detail including initial materials of products.

TITLE: On the Reaction of Hydrazine Derivatives
(Reaktsii proizvodnykh gidrazina).
XVIII. On the Effect of the Acid Agent on Azines
(XVIII. O deystvii kislotnykh agentov na aziny).

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 2, pp. 512-518
(USSR)

ABSTRACT: The descriptions of the effect of the acyl halides on azines are very contradictory. The results obtained by Minnani et al. (ref. 5), Lochte et al. (ref. 6) and Benary (ref. 7) cannot be brought in line. Benary's observation of the transformation of cyclohexane azine into octahydrocarbazole was confirmed, however, it was not possible to use the reaction for other azines. A compound with the melting point 236°C was obtained from acetone azine with benzoyl chloride equal to that obtained by Lochte which, however, was no benzoylpyrazoline but was symmetrical to dibenzoylhydrazine. In the case of complete elimination of humidity the same reaction however, actually produces benzoylpyrazoline which, however, shows completely different properties (melting point 93°C) and was

Card 1/3

On the Reaction of Hydrazine Derivatives.

79-2-51/64

XVIII. On the Effect of the Acid Agent on Azines

characterized first by the authors of the present work. The cleavage of the azines under formation of the symmetry of the diacylhydrazines was observed also on the occasion of the action of benzoyl chloride on azines of the methylisopropylketone or of the cyclopentanone. Beside the usual determinations of configuration N. B. Kupletskaya (ref. 9) also put down the corresponding absorption spectra. It is stated that the occurrence of a cleavage or a cyclization depends not so much on the nature of azine and the acylating agent but on the reaction conditions. If humidity is in the reaction mass, mainly a cleavage of the azine takes place. On the occasion of cyclization of cyclopentanone azine with anhydrous formic acid the compound $C_{15}H_{22}N_2$ was obtained.

According to V. A. Koptsik (Physical Faculty of Moscow State University it shows, among other, a strong piezoelectric effect. It was observed that cyclohexanoneazine reacts energetically to phosphorous tribromide and that β , β' -dibromodiethylether (due to the dioxane ring cleavage) is formed in dioxane with octohydrocarbazole.

TITLE: An Investigation of High Boiling Fractions of Coal Tar using the Method of Chromatographic Analysis (Issledovaniye vysokokipyashchikh fraktsiy kamennougol'noy smoly metodom khromatograficheskogo analiza)

PERIODICAL: Koks i Khimiya, 1958, Nr 11, pp 51-54 (USSR)

ABSTRACT: An attempt to apply the chromatographic method for determining the group chemical composition of crude unpurified fractions of coal tar is described. The method adopted was as follows: 18g samples were passed through two columns in series filled with silicagel; for desorption the following solvents (200ml each) were used in succession: n-hexane, n-hexane + benzole; benzole, ethyl ether, alcohol-benzene, ethyl alcohol and acetone. Primary identification of desorbed hydrocarbons and organic compounds was based on the colour of the solutions and chromatographic curves (Fig 1). This was later confirmed by coefficients of refraction, melting temperatures, molecular weights (cryoscopy in benzene) and iodine numbers of products freed from solvents. Physico-chemical characteristics of the

Card 1/3

An Investigation of High Boiling Fractions of Coal Tar using the
Method of Chromatographic Analysis

identified groups of compounds for the investigated coal tar fractions are given in Table 1, physico-chemical characteristics of the coal tar fractions investigated in Table 2, and the results of their chromatographic analysis in Table 3. The following chemical groups were separated:

- 1) paraffinic, naphthenic and olefinic hydrocarbons,
- 2) monocyclic aromatic hydrocarbons, 3) naphthenic-aromatic hydrocarbons and phenylalkenes, 4) dicyclic aromatic hydrocarbons, 5) phenanthrene group,
- 6) anthracene group, 7) tricyclic hetero compounds,
- 8) pyridene bases and 9) phenols and other acid compounds.

On the basis of the chromatographic analysis the number of aromatic rings and the content of carbon in aromatic structures for mean molecule of the samples investigated were calculated, whereupon the molecule weight was taken as the same for all groups and equal to the molecular

TITLE: The Chemical Composition of Crude Petroleum Products Used in the Manufacture of Carbon Black (O khimicheskom sostave neftyanogo syr'ya dlya proizvodstva sazi)

PERIODICAL: Kachuk 1, Rezina, 1958, Nr 8, pp 12 - 14 (USSR)

ABSTRACT: The kerosine-gas-oil fraction (obtained during pyrolysis and coking of petroleum) is used as raw material for the preparation of jet carbon black in the USSR. In the USA and England aromatised gas-oil fractions, obtained during the thermal and catalytic processing of petroleum, are used for the manufacture of the activated carbons HAF, ISAF and SAF. No detailed investigations have been published on the effect of the chemical composition of the raw material on the yield and properties of the carbon black. The nature of the gas-oil fraction of crude petroleum and its products is defined by the GrozNII method by which the percentage of aromatic, naphthenic, paraffinic and olefinic hydrocarbons is determined. The authors used the n-d-M method (Ref.3) for defining the composition of the pyrolysis and of the coke distillate. They determined by experiment the molecular weight M , the refractive index n_D^{20} and the specific weight d_4^{20} . The hydrocarbon content was de-

finned by chromatographic analysis according to the TsIATIM method (Ref.6) and the degree of unsaturation of the samples was determined iodometrically. The physico-chemical characteristics of the samples of raw material are listed in Tables 1 and 2, and results of the chromatographic analysis in Table 3. The total content of pure paraffins and olefins in the pyrolysis fraction does not exceed 5%; therefore, this fraction consists of aromatic and naphthenic-aromatic hydrocarbons, two condensed rings and partially unsaturated side chains. The content of paraffinic-naphthenic hydrocarbon in the coke distillate fraction varies between 40 - 53%. Approximately 50% of this quantity represents pure paraffinic and olefinic hydrocarbons and it comprises 27% bicyclic aromatic hydrocarbons. The degree of aromatization increases in both

fractions when the temperature is raised (Table 5).
The degree of aromatization and cyclisation can be
increased in the coke distillate fraction by boosting
the content of high boiling-fractions. There are 5

The influence of nucleic acid on the thermal stability of a protein. A. I. Oparin and T. N. Evreinova. *Doklady Akad. Nauk S.S.S.R.* 54, 253-5 (1947); *Chem. Zvest. (Russian Zone Ed.)* 1(48), 1, 1323-4. — The purpose of the investigation was to det. the behavior of the nucleoprotein of thermophilic bacteria at high temps. The criterion of thermal denaturation was the change in the soly. of the protein treated. The protein sample in the form of an aq. suspension was exposed to temps. of 20-100° for 30 min., then cooled, and a 0.1% NaOH soln. was added to give a concn. of 0.2%. This concn. of 0.2% was chosen because the thermophilic bacteria were extd. at this concn. and "dissolved" well under these conditions. After the heat-treatment the following were detd.: N of the still-sol. protein; N of the fraction insol. in CCl_3CO_2H (to detect hydrolysis); and N in the residue. The nucleoprotein of the thermophilic bacteria, like wheat glutenin and edestin, was found to be quite stable. Denaturation began only at about 80° and amounted to about 40% at 90°. Nucleic acid of yeast belongs to the same class of nucleoproteins; therefore synthetic prepn. contg. this nucleic acid were investigated. The nucleic acid compd. of glutenin and that of the protein of egg white showed a high thermal stability; edestin nucleic acid compd. was somewhat less stable. The nucleic acid of yeast prevents to a certain degree coagulation by heat. M. G. Moore

The formation of maltose by the action of phosphorylase and amylase on glucose-1-phosphate. A. I. Opatin and T. N. Bircinova. *Melland Tschuber*. 29, 311-12 (1948); *Chem. Zentr. (Russian Zone Ed.)* 1948, II, 1096. —A study was made of the simultaneous action of the 2 enzymes, phosphorylase (I) and amylase (II), on the cryt. dipotassium salt of glucose-1-phosphate (III) in homogeneous soln. I was prepd. from potatoes by the method of Kadin and Franov (cf. *C.A.* 19, 3559; 40, 6623) and II was obtained from soybeans by the method of Laufer, Tauber, and Davis (cf. *C.A.* 16, 6268). The action of the I was measured by the amt. of inorg. P split off, according to the method of Fiske and Subbarow (cf. *C.A.* 24, 389). The action of the β -II was measured on the basis of the sol. starch by detn. of the reducing substances according to Bjerrey. The procedure used was as follows: 30-40 mg. III, 1 cc. I, 10 mg. β -II, 2 mg. starch, and 15 cc. 0.1 N with respect to NaOH were mixed at 20-25°. After 1 hr. inorg. P was detd. Maltose was also detd. from the difference in the amt. of reducing substances present in a sample of the mixt. before and after boiling 15 min. with 2% HCl. The decompos. of III, obtained from the maltose and P values, was 60-70%. The following representation of the reaction is offered: glucose-1-phosphate $\xrightarrow{\text{phosphorylase}}$ polysaccharide $\xrightarrow{\text{amylase}}$ maltose. M. G. Moore

the acorn amylase complex. T. N. Kuznetsov and V. G. Nikolaeva. *Doklady Akad. Nauk S.S.S.R.* 73, 1235-7 (1950).—The acorn cotyledons contain both α - and β -amylases, whose action is responsible for utilization of starch during sprouting. The enzymes can be detected only after removal of the inhibiting effects of tannins by treatment with peptone. The amylase system exists in a sol. form, as well as in an insol. one that is manifested by 6-hr. autolysis at 33°. In sprouts only the former is found. Storage does not decrease the total enzymic activity. During growth the sol. form increases at the expense of the insol. form. G. M. Kosolapoff

Hydrolytic enzymes of acorns. T. N. Borelnova and V. G. Nikolaeva. Vestnik Mosk. Univ. 6, Ser. Fiz.-Mat. i Biolog. Nauk No. 3, 113-114 (1951).--In acorns of *Quercus robur* there are present invertase, α - and β -amylase, and no indication of maltase. The activity of the amylases was demonstrable only after removal of the inactivating tannins by means of peptone. Direct tests on germinated specimens give very low enzyme activity. Most amylolytic enzymes are coded in the cotyledons. The amylase system contains a sol. and an insol. form, the latter being detected after 6 hrs. autolysis. The sol. form is found in the seed sprouts. In storage the total amylase activity is unchanged. During sprouting the sol. amylase activity increases at the expense of the insol. fraction. G. M. Kosolapoff

Title : Amylase in Acorns Stored Under Various Conditions.

Orig Pub : Vestn. Mosk. un-ta, ser. biol., pochvoved., geol., geogr., 1956, No 2, 39-43.

Abstract : When Quercus robur acorns were kept in damp sand exposed to air O₂ in temperature, the amylase activity in the seedlings and cotyledons increased in April, and the germ iation was good. Under the same conditions in jars with N₂ or CO₂ there was an increase in the ferment activity in the cotyledons and a gradual disappearance of it in the shoots which also ceased germinating. Acorns which were kept in sieves in a cement well at a temperature of 5°-10° above
